Physics Advanced Unit 4: Physics on the	ne Move		
Monday 30 October 2017 – Time: 1 hour 35 minutes	- Morning		Paper Reference WPH04/01
You must have: Ruler			Total Marks

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided
 - there may be more space than you need.

Information

- The total mark for this paper is 80.
- The marks for **each** question are shown in brackets
 - use this as a guide as to how much time to spend on each question.
- Questions labelled with an asterisk (*) are ones where the quality of your written communication will be assessed
 - you should take particular care with your spelling, punctuation and grammar, as well as the clarity of expression, on these questions.
- The list of data, formulae and relationships is printed at the end of this booklet.
- Candidates may use a scientific calculator.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

SECTION A

Answer ALL questions.

For questions 1–10, in Section A, select one answer from A to D and put a cross in the box ⊠. If you change your mind, put a line through the box ₩ and then mark your new answer with a cross ⊠.

1	Which of the following are the base units of momentum?
	\triangle A kg m s ⁻¹
	\square B kg m s ⁻²
	C Ns
	\square D N s ⁻¹
	(Total for Question 1 = 1 mark)
2	A linac is a particle accelerator. It consists of drift tubes with potential differences (p.d.) applied between them.
	The drift tubes increase in length. This is so that
	A a very high accelerating p.d. can be used.
	B the accelerating p.d. used can have a constant frequency.
	\square C the particle acquires the same amount of energy in each tube.
	D the time spent in each tube increases as the length of each tube increases.
_	(Total for Question 2 = 1 mark)
3	A food mixer has a blade which completes 15 000 revolutions in a minute.
	Which of the following is the angular velocity of the blade in rad s ⁻¹ ?
	■ B 250

(Total for Question 3 = 1 mark)

D 94200

4 The de Broglie wavelength associated with electrons used to study crystal structure is 2.8×10^{-10} m.

Which of the following is the speed of the electrons?

mass of electron = 9.11×10^{-31} kg

- \triangle **A** 3.8 × 10⁻⁷ m s⁻¹
- \blacksquare **B** 7.4 × 10⁻⁴ m s⁻¹
- \bigcirc C 1.4 × 10³ m s⁻¹
- \square **D** 2.6 × 10⁶ m s⁻¹

(Total for Question 4 = 1 mark)

5 A square coil of side length *l* has *N* turns. Its plane is parallel to a magnetic field of magnetic flux density *B*.

Which of the following is the flux linkage with this coil?

- $\mathbf{A} \cdot \mathbf{A} \cdot \mathbf{0}$
- \square **B** B
- \square C NB
- \square **D** NBl^2

(Total for Question 5 = 1 mark)

6 A particle accelerator produces a beam of very high energy protons.

Which of the following statements describes the speed of a proton as it passes through the accelerator?

- **A** It increases uniformly.
- **B** It never reaches the speed of light.
- C It stops increasing when it reaches the speed of light.
- **D** It reduces as it approaches the speed of light.

(Total for Question 6 = 1 mark)

7 A particle Y has kinetic energy E and momentum p. A second particle Z of the same mass as Y has momentum 2p.

Which of the following is the kinetic energy of Z?

- \triangle A 4E
- \blacksquare **B** 2E
- \boxtimes C E
- \square **D** $\frac{E}{2}$

(Total for Question 7 = 1 mark)

8 A resultant force of 10 N acts on a particle of mass 0.2 kg for 30 s. The particle is initially at rest.

Which of the following expressions gives the velocity in m s⁻¹ of this particle after 30 s?

- $\triangle A \frac{10 \times 0.2}{30}$
- $\square \quad \mathbf{B} \quad \frac{10 \times 30}{0.2}$
- \square C $\frac{0.2 \times 30}{10}$
- \square **D** $0.2 \times 30 \times 10$

(Total for Question 8 = 1 mark)

- **9** Which of the following is the name of the process by which electrons are released from a heated filament?
 - **A** ionisation
 - **B** photoelectric effect
 - C relativistic effect
 - **D** thermionic emission

(Total for Question 9 = 1 mark)

DO NOT WRITE IN THIS AREA

10 A car, mass m, drives over a circular humpback bridge of radius r with a constant speed v.

When it is at the top of the bridge, the magnitude of the force exerted on the car by the bridge is given by

- \triangle A mg
- \square **B** $\frac{mv^2}{r} + mg$
- \square C $\frac{mv^2}{r} mg$
- \square **D** $mg \frac{mv^2}{r}$

(Total for Question 10 = 1 mark)

TOTAL FOR SECTION A = 10 MARKS

SECTION B

Answer ALL questions in the spaces provided.

11 A plane is flying at a constant velocity, as shown.

The pilot banks the plane and the lift force L is now inclined at an angle θ to the vertical.

(a) Explain why this will result in circular motion.

(2)

(b) The plane continues to fly with a constant speed v.

The angle θ is given by

$$\tan\theta = \frac{v^2}{rg}$$

where r is the radius of the circular path.

(i) Show that this equation is correct.

(3)

(ii) Calculate the radius of the circular path.

(2)

$$v = 150 \,\mathrm{m \, s^{-1}}$$
$$\theta = 10^{\circ}$$

Radius =

(c) Scientists studying antimatter recently observed the creation of an anti-helium 4 nucleus, which consists of two anti-protons and two anti-neutrons.

The diagram represents the path of a proton through a magnetic field starting at point A.

Add to the diagram the path of an anti-helium 4 nucleus also starting at point A and initially travelling with the same velocity as the proton.

Explain any differences between the paths.

(4)

- 13 A student carries out an experiment to charge a capacitor through a resistor. She intends to measure the current during this process.
 - (a) (i) Draw a circuit that she could use.

(2)

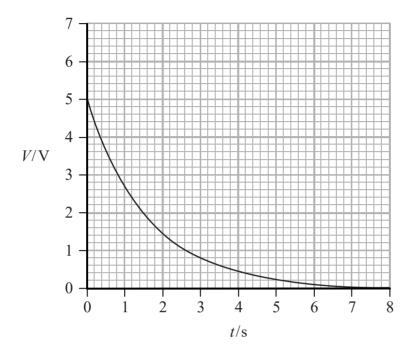

(ii) Sketch a graph to indicate how the current will vary with time from when the capacitor starts to charge.

(2)

(b) Once the capacitor is fully charged, the student discharges it through a 1.0 k Ω resistor. She measures the potential difference V across the capacitor during this process.

The graph below shows the variation of V with time t.

Show that the capacitance of the capacitor is about 2 mF.

17 A student places two coins, A and B, of the same mass on a flat surface. He pushes coin A towards coin B and observes what happens when they collide. He repeats this several times, recording the collisions on his phone.

*(a) He analyses the recordings and notices that if coin A collides head-on with coin B, then after the collision coin A stops and coin B moves off in the same direction.

Assuming external forces are negligible, discuss whether the collision is elastic.

(b) If coin A collides with coin B at an angle, both coins move off in different directions after the collision, as shown in the diagram.

(i) Show that the velocity of coin A immediately after the collision is about 3 cm s⁻¹.

(ii) Determine the initial velocity of coin A just before the collision.

(3)

Initial velocity =

n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
a another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its	a another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its rength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its	me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This time the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This time the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This time the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This time the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
nother demonstration, a magnetic field of flux density B is applied to the grid. This is the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the es is changed so that the electric field is in the same direction as before, but so its	nother demonstration, a magnetic field of flux density B is applied to the grid. This is the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the es is changed so that the electric field is in the same direction as before, but so its ngth is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its crength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
n another demonstration, a magnetic field of flux density B is applied to the grid. This ime the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This time the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This time the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This time the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	n another demonstration, a magnetic field of flux density B is applied to the grid. This me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
time the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its	me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.
In another demonstration, a magnetic field of flux density B is applied to the grid. This time the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the plates is changed so that the electric field is in the same direction as before, but so its strength is now $25000\mathrm{NC^{-1}}$.	me the electrons enter the fields with a velocity of $2.4 \times 10^7 \mathrm{ms^{-1}}$. The p.d. across the lates is changed so that the electric field is in the same direction as before, but so its trength is now $25000\mathrm{NC^{-1}}$.

Fields

Coulomb's law $F = kQ_1Q_2/r^2$ where $k = 1/4\pi\epsilon_0$

Electric field E = F/Q

 $E = kQ/r^2$ E = V/d

Capacitance C = Q/V

Energy stored in capacitor $W = \frac{1}{2}QV$

Capacitor discharge $Q = Q_0 e^{-t/RC}$

In a magnetic field $F = BIl \sin \theta$

 $F = Bqv \sin \theta$

r = p/BQ

Faraday's and Lenz's laws $\varepsilon = -d(N\phi)/dt$

Particle physics

Mass-energy $\Delta E = c^2 \Delta m$

de Broglie wavelength $\lambda = h/p$
